## CONNECTIONS

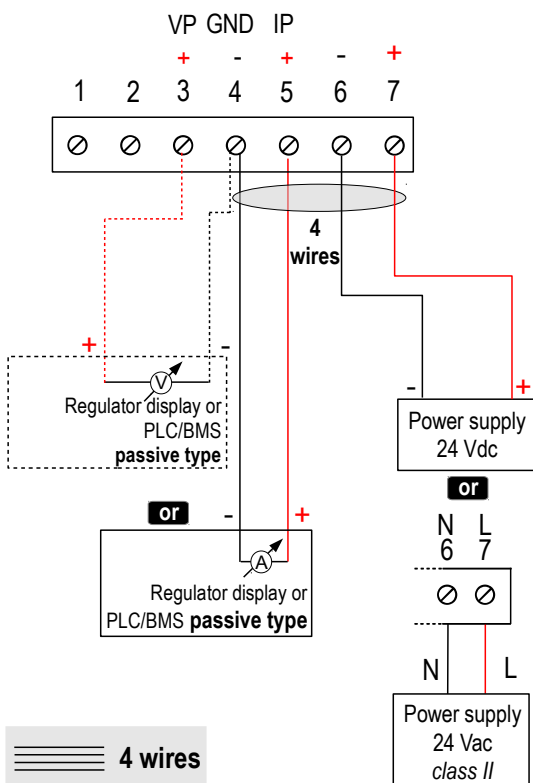

## ELECTRICAL CONNECTIONS – as per *NFC15-100* standard

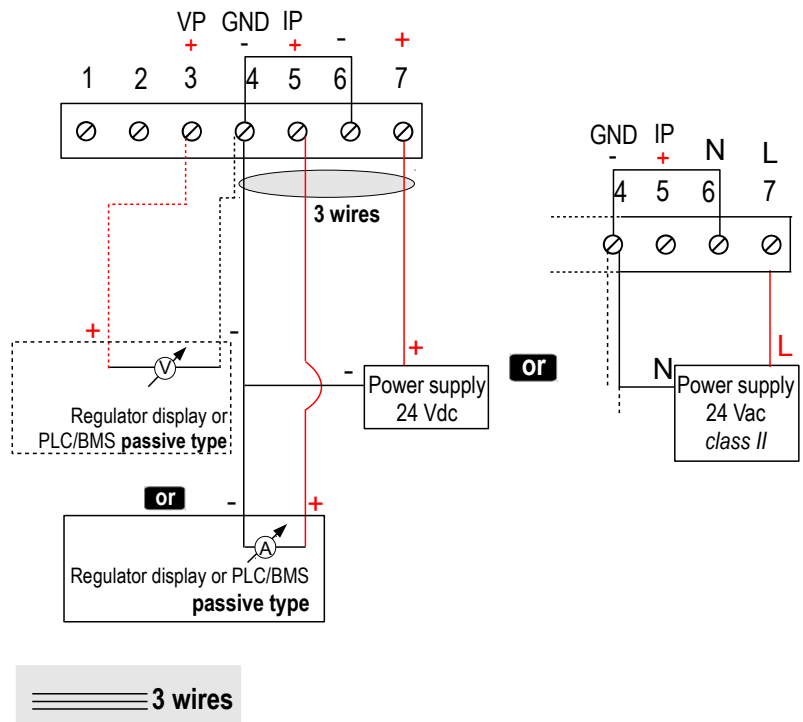

This connection must be made by a qualified and trained technician. To make the connection, the transmitter must not be energized.

For CP111/112/113 – AO models and CP111/112/113 – AN models with 0-10 V or 4-20 mA output – active, 4 wires :

To make a 3-wire connection, before powering up the transmitter, please connect the output ground to the input ground. See drawing below.

For CP112/113 – PO models and CP112/113 – PN models with 4-20 mA output – **passive** :

## SETTINGS AND USE OF THE TRANSMITTER

### > Auto-calibration

CP 111 pressure transmitter has a temperature compensation of the gain from 0 to 50 °C and an auto-calibration process that guarantees over the time an excellent stability and a perfect reliability of the measurement on low and high ranges.

Auto-calibration principle : the microprocessor of the transmitter drives a solenoid valve that compensates the possible drifts on the sensitive element over the time. The compensation is performed by the permanent adjustment of the zero. So the measurement of the differential pressure is then independent from the environmental conditions of the transmitter.

**Advantage** : no drift

**Frequency of auto-calibration** : resetable or from 1 to 60 minutes

### > Autozero

To perform an autozero, unplug the 2 pressure connections tubes and press the “**Autozero**” key.

On the CP111 transmitter, it is not necessary to unplug the 2 pressure connection tubes.

When an autozero has been performed, “**On**” green light turns off then turns on, and on transmitters equipped with a display, “**autoZ**” is displayed.

### > Configuration

To configure the transmitter, it must not be energized. Then, you can make the settings required, with the DIP switches (as shown on the drawing below). When the transmitter is configured, you can power it up.

To configure the transmitter, unscrew the 4 screws from the housing then open it. DIP switches allowing the different settings are then accessible.

### > Measuring range settings – left DIP switch

To set a measuring range, put the 1, 2 and 3 on-off switches as indicated in the table below.

You can configure your own intermediary ranges.

**Caution : the minimum difference between the high range and the low range is 20.**

For example, it is possible to set the instrument from -20 to 0 Pa, from 0 to +20 Pa, or from -10 to +10 Pa...

- To access the configuration via software :
  - Set the DIP switches as shown beside. *Nota : the on-off switch 1 of the right DIP switch can be in any position (selection of the analogue output 0-10 V or 4-20 mA)*
  - Connect the cable of the LCC-S to the connection of the transmitter.
- Please refer to the user manual of the LCC-S to make the configuration.

**The configuration of the parameters can be done either with the DIP switch or via software (you can not combine both solutions).**

**MOUNTING**

To mount the transmitter, mount the ABS plate on the wall (drilling : Ø6 mm, screws and pins are supplied). Insert the transmitter on the fixing plate (see A on the drawing beside). Rotate the housing in clockwise direction until you hear a "click" which confirms that the transmitter is correctly installed.

**Once the transmitter is installed and powered up, please make an autozero to guarantee the correct working of the transmitter in any position.**

**MAINTENANCE**

Please avoid any aggressive solvent. Please protect the transmitter and its probes from any cleaning product containing formalin, that may be used for cleaning rooms or ducts.
